SUMMARY

Product engineer with 5 years shipping TypeScript and React products end to end, from wallet-connected interfaces to the on-chain systems behind them. Built production web and React Native apps on EVM and Aptos, including credit-product flows used by originators and borrowers, and WalletConnect, Valora, and wagmi signing flows. Owns features past the commit: documentation, GitHub Actions release paths, and operation of a daily agent workflow (MCP, tool use, research-to-publish). Comfortable across UI, API-backed product flows, and EVM fundamentals. Seeking a Product Engineer role building shared product platforms and AI-agent infrastructure.

SKILLS

- Languages: TypeScript, JavaScript, Solidity, Aptos Move
- Frontend and product UI: React, React Native, Next.js, Vite, Tailwind CSS, pnpm
- Web3 applications: EVM, wallet authentication, transaction signing, WalletConnect, Valora, wagmi, viem, Reown AppKit (embedded and external wallets)
- AI and agents: MCP, agent workflows, tool-using research and publish pipelines, LLM-assisted product systems
- APIs and delivery: Node.js, Firebase, GitHub Actions, product documentation, Foundry tests (unit and invariant)
- Protocols shipped: Ethereum, Base, Polygon, Aptos, Celo, BNB

EXPERIENCE

CTO, ADPR Memetic Brand Labs

Feb 2026 – Present

Remote

- Own end-to-end delivery of Thought Leadership Signal, a daily agent workflow that takes a source through brief, copy, creative, schedule, and publish on X and LinkedIn.
- Built the operating path in TypeScript tooling: research inputs, tool-using agent steps, living docs, and a GitHub Actions publisher that ships due posts on a schedule.
- Treat an area as done only when it runs: dry-run versus live publish, idempotent scheduling, and first-line fixes when a post fails.
- Decide what becomes shared system versus a one-off, so the next day's product reuses the same pipeline instead of a copied script.

Head of Web3, CosX

Mar 2025 – Present

Remote

- Turn partner and product constraints into delivery plans for credit, payments, and on-chain surfaces, then stay with the work through release readiness.
- Raise scope and risk early with founders and product managers when an on-chain design will not survive the credit lifecycle (origination, repayment, monitoring, settlement).

Full-Stack Engineer, On-chain Credit, Pact Labs

Mar 2025 – Feb 2026

Remote

- Designed and shipped smart contracts on EVM and Aptos for on-chain lending and private credit products that reached over \$1.5B.
- Built the React Native product used in production: wallet connect, credit status, and lifecycle for originators and borrowers.

- Wrote architecture and onboarding docs so the next engineer could change the system without a tour from the author.
- Partnered with the CTO and product managers to convert off-chain credit structures into auditable on-chain flows.

Web3 Full-Stack Engineer, Equistart Labs

Jun 2022 – Mar 2025

Remote

- Owned three products from scope through production: a Balancer-style and Uniswap V3 DEX, a crypto index with rebalancing, and Simpli DAO (proposals, token voting, payouts).
- Implemented pool logic, fee mechanics, and rebalancing in Solidity and Foundry, with React and React Native clients, WalletConnect, and dashboard data for users.
- Shipped a Balancer V3 volatility fee hook that won the DoraHacks Hookathon (\$2,000) and a Celo DAO suite that won Build With Celo (\$2,500), both as working products with docs.

Developer Relations Engineer, Celo Foundation

Mar 2022 – May 2022

Remote

- Built the React Native starter (WalletConnect, Valora, transaction signing) that 20+ hackathon teams used as their default mobile dApp base.
- Wrote tutorials that shortened time to first transaction, and debugged architecture with teams through prize-winning submissions.

Full-Stack and Mobile Engineer, ETG India

Jan 2021 – Jun 2021

- Shipped an insurtech React Native app to Google Play: Firebase backend, GCP image recognition, and a Dialogflow conversational flow. First production mobile product, owned through release.

SELECTED PRODUCTS

- Portfolio (abhinil.in): React, TypeScript, Vite, pnpm, wagmi, viem, Reown AppKit wallet connection.
- Thought Leadership Signal: agent research-to-publish system, tool-using steps, GitHub Actions deploy path.
- On-chain private credit: Aptos Move and EVM contracts plus React Native wallet and lifecycle UI. Over \$1.5B lending and private credit.
- Celo React Native starter: WalletConnect and Valora signing flows. Adopted by 20+ teams.
- Potshot: Solidity and React raffle live on Base.
- Balancer V3 volatility fee hook: Foundry. DoraHacks winner.

AWARDS

- 1st place, Harmony Hackathon (Gitcoin): on-chain wallet frontend, React Native, \$20,000 (2021)
- Build With Celo: Equistart DAO suite, \$2,500 (2022)
- Balancer Hookathon (DoraHacks): volatility fee hook, \$2,000 (2024)
- Green NFT Hackathon (Gitcoin): NFT sustainability research, \$1,700 (2021)

EDUCATION

Integrated M.Tech, Computer Science and Engineering, IIIT Bangalore, 2016–2021
